Irreplaceable Middlemen? Evidence from the Expulsion of Indians from Uganda

Abstract. Does the ethnic majority gains from the expulsion of a middlemen minority? Such policies are justified by the gains they promise its majority, yet those gains are rarely examined. I leverage the 1972 expulsion of Indians from Uganda, which removed a minority of less than one percent of the population that dominated crop buying, processing, and wholesale trade. Using newly digitized census and road-network data and quasi-random variation from delays in a road-upgrading program, I find that households in localities more exposed to the loss of Indian middlemen obtain less crop value from their farmland four decades later. A one-standard-deviation increase in exposure to the loss of Indian middlemen lowers crop value by 17 percent, or one-sixth of the household's annual crop value. These losses are not explained by differences in land use, a contraction of the local economy, a loss of credit and inputs, out-migration and are unlikely to operate through lost human capital. Instead, they operate through disintermediation: the decline is largest for the most marketed crops, which depend most on intermediation, and more-exposed households are less likely to sell to traders and sell a smaller share of their output through traders. This is consistent with the destruction of the intermediation the minority provided rather than its transfer to the majority. Altogether, the results suggest that the expulsion left the majority economically worse off in the long-run.

The Political Economy of Intergroup Contact: Evidence from Malaysia (with Gedeon J. Lim, Danial Shariat, Abu Siddique, and Shunsuke Tsuda)

Abstract. Are there particular social structures that allow ethnic diversity to coexist with political stability and economic prosperity? This paper examines the effects of interethnic proximity on political identity and economic development. We exploit fine-grained spatial variation from a British colonial resettlement policy in Malaysia (1948-1951), which forcibly relocated over half a million ethnic minority Chinese into segregated "Chinese New Villages" (CNVs). We find that ethnic majority Malays residing in polling districts closer to CNVs exhibit lower contemporary electoral support for the ethnonationalist coalition, potentially reflecting a moderation of ethnonationalistic political identity. We also observe moderately positive impacts on contemporary economic prosperity. Positive political effects are stronger in regions with initial, historical interethnic complementarities—even in the absence of persistent economic prosperity. Novel primary survey data reveal that Malays living in closer proximity to CNVs report greater contact with Chinese, higher interethnic trust, and weaker zero-sum beliefs. Suggestively, these effects appear to be reversed in areas with greater interethnic competition. Throughout, broader impacts on social integration remain muted. Our findings highlight the promise and pitfalls of intergroup contact in jointly underpinning political moderation and economic development.

The Visibility Premium: Article Order and Citations (*R&R at Economic Inquiry*) (with ⓡ Francesco Lippi and ⓡ Sascha O. Becker)

Abstract. We exploit a natural experiment to identify the causal effect of the order with which articles appear within a journal issue on citations. Using data on 1,456 articles published in the *Economic Journal* between 2010 and 2024, we find that articles appearing earlier in an issue receive substantially more citations throughout the sample period. Articles ranked 7–9 receive 17% fewer two-year citations than those ranked 1–3, with effects growing to 28% over five years. Between December 2015 and February 2025, the journal switched from chronological to alphabetical ordering, allowing us to disentangle rank (visibility) effects from alphabetical (name) effects. Analysis of views and downloads confirms a visibility mechanism, with important implications for editorial practices.
